

ABSTRACT OF THE DISCLOSURE

An auxiliary lens for a camera and the like includes a washer to be mounted to a camera and an auxiliary-lens body to be joined to the washer to thereby be mounted to the camera. The auxiliary-lens body has an adsorbing section made of a permanent magnet, a ferromagnetic substance or a magnetic substance at the position to be mounted to the camera. The washer is made of a ferromagnetic substance, a magnetic substance or a permanent magnet that can be adsorbed to the adsorbing section of the auxiliary-lens body. Thus, mounting the washer to the camera with a double-faced tape or the like allows the auxiliary lens to be mounted to the camera and the like through the washer by a magnetic force.
